SOLUÇÃO ISOPARAMÉTRICA

- O maior avanço na implementação do MEF foi o desenvolvimento de um elemento isoparamétrico com capacidades para modelar problemas com geometrias de qualquer forma e tamanho.
- A ideia principal está no **mapeamento**:
 - O elemento da estrutura real é *mapeado* para um elemento *imaginário* em um sistema de coordenadas ideal;
 - A solução para o problema de análise de tensão é fácil e conhecida para o elemento de *imaginário*;
 - Estas soluções são mapeados de volta para o elemento da estrutura real;
 - Todas as cargas e condições de contorno também são mapeadas a partir do real para o elemento *imaginário* nesta abordagem.

PORTANTO...

- A formulação isoparamétrica torna possível gerar elementos que não sejam retangulares e elementos curvos. A *família isoparamétrica* inclui elementos planos, sólidos, placas, cascas...
- É mais eficiente para ser implementada computacionalmente.
- Há também elementos especiais para Mecânica da Fratura.

INTERPOLAÇÃO

Há duas interpolações importantes em EF

- Definição da locação dos pontos dentro do elemento, em termos de seus valores nodais (interpolação de geometria)
- Definição do deslocamento nos pontos dentro dos elementos, em termos de seus valores nodais (interpolação de resultados)

Relação entre deslocamentos/coordenadas em qualquer ponto e deslocamentos/coordenadas nos pontos nodais do elemento é obtida diretamente através das **FUNÇÕES DE INTERPOLAÇÃO OU FUNÇÕES DE FORMA**, através da utilização de um **sistema de coordenadas natural**.

PORQUE ISOPARAMÉTRICOS?

ISOPARAMÉTRICO = MESMOS PARÂMETROS

- Não há nenhuma razão fundamental para que a interpolação seja a mesma para geometria e resultados;
- Porém, para uma classe extremamente versátil de elementos, deslocamentos e Coordenadas são interpolados com as mesmas *Funções de Forma*.

$$u(x) = N(x)d$$

d : deslocamentos nodais

\check{x} : coordenadas nodais

$$N = \check{N} \text{ Isoparamétrico}$$

$$N > \check{N} \text{ Subparamétrico}$$

$$N < \check{N} \text{ Superparamétrico}$$

$$x = \check{N}(x)\check{x}$$

$N > \check{N}$
subparamétrico

$N = \check{N}$
isoparamétrico

$N < \check{N}$
superparamétrico

Ponto utilizado para aproximar geometria

Ponto utilizado para aproximar deslocamento

DILEMA

- A maior razão do MEF fazer sucesso na engenharia é a possibilidade de modelar geometrias complexas;
- Porém, elementos dão resultados mais precisos em geometrias regulares (triângulos isósceles, quadrados);
- O software sempre terá que minimizar uma distorção quando cria a malha;
- Importante entender como as funções de forma (interpolação) são formuladas;

CONDIÇÕES

As *funções de forma* ou *interpolação* interpolam a variável em questão (coordenada/deslocamento) por meio de seus valores nos pontos nodais. Portanto, uma condição imediata que as funções de interpolação devem satisfazer é,

$$N_i(x) = \begin{cases} 1 & \text{para } x = x_i \\ 0 & \text{para } x = x_j \quad i \neq j \end{cases}$$

As *funções de deslocamento* devem garantir a existência de movimento de corpo rígido,

$$u \cong \sum_{i=1}^n N_i(x) u_i = \bar{u} \sum_{i=1}^n N_i(x) = \bar{u} \quad \therefore \sum_{i=1}^n N_i(x) = 1$$

O produto da primeira derivada das *funções de interpolação* deve ser integrável no intervalo $[x_i, x_j]$ do elemento para garantir que as constantes K_{ij} da matriz de rigidez possam ser obtidas da integração do produto das funções dN_i/dx e dN_j/dx .

MAPEAMENTO ISOPARAMÉTRICO 1D

r : sistema natural de coordenadas, independente do comprimento físico L da barra.

$$u(x) = \mathbf{N} \mathbf{d} = \sum_{i=1}^2 N_i u_i$$

Para calcular u em um ponto qualquer da barra, substitui-se a coordenada r do ponto em \mathbf{N} .

\mathbf{N} : funções de interpolação ou funções de forma

ELEMENTO DE 3 NÓS (QUADRÁTICO)

$$N_1 = r \frac{(r-1)}{2}$$

$$N_2 = r \frac{(1+r)}{2}$$

$$N_3 = (1 - r^2)$$

$$N_1 = N_{1(2nós)} - \frac{1}{2} N_3$$

$$N_2 = N_{2(2nós)} - \frac{1}{2} N_3$$

MAPEAMENTO ISOPARAMÉTRICO 1D

**Coordenadas locais
(isoparamétrico)**

$$N_1(r) = -\frac{r(1-r)}{2}$$

$$N_2(r) = \frac{r(1+r)}{2}$$

$$N_3(r) = 1 - r^2$$

**Mapeamento
isoparamétrico**

$$x = \sum_{i=1}^3 N_i(r) x_i$$

$$x = -\frac{r(1-r)}{2} x_1 + \frac{r(1+r)}{2} x_2 + (1-r^2) x_3$$

Dado um ponto nas coordenadas isoparamétricas, posso obter o correspondente ponto traçado nas coordenadas globais usando a equação isoparamétrica de mapeamento.

$$x = -\frac{r(1-r)}{2}x_1 + \frac{r(1+r)}{2}x_2 + (1-r^2)x_3$$

$$r = -1 \rightarrow x = x_1$$

$$r = 0 \rightarrow x = x_3$$

$$r = 1 \rightarrow x = x_2$$

Pergunta:
 x em $r = 0.5$?

$$x = -\frac{1}{8}x_1 + \frac{3}{8}x_2 + \frac{7}{8}x_3$$

EXEMPLO 01 – MAPEAMENTO

- Ache o mapeamento $x(r)$ para o elemento de 3 nós abaixo:

$$x = -\frac{r(1-r)}{2}x_1 + \frac{r(1+r)}{2}x_2 + (1-r^2)x_3$$

$$x_1 = 0, x_2 = 4, x_3 = 2$$

$$x = 2r + 2$$

r	x
-1	0
-1/2	1
0	2
1/2	3
1	4

EXEMPLO 02 – MAPEAMENTO

$$x = -\frac{r(1-r)}{2}x_1 + \frac{r(1+r)}{2}x_2 + (1-r^2)x_3$$

$$x_1 = 0, x_2 = 4, x_3 = 3$$

$$x = -r^2 + 2r + 3$$

r	x
-1	0
-1/2	1,75
0	3
1/2	3,75
1	4

ACHO QUE TEMOS UM PROBLEMA....

Nós conhecemos o mapeamento...

$$x = \sum_{i=1}^3 N_i(r) x_i$$

Porém, a matriz de rigidez é calculada como:

$$\mathbf{K} = \int_V \mathbf{B}^T \mathbf{D} \mathbf{B} dV$$

Onde: $\mathbf{B} = \frac{d\mathbf{N}}{d\mathbf{x}}$

There's no
such thing as
a free lunch.

— Milton Friedman

Como computar a matriz \mathbf{B} ???

$$N_2(r) = \frac{r(1+r)}{2}$$

$$x(r) = -r^2 + 2r + 3$$

Invertendo...

$$r = 1 - \sqrt{4 - x}$$

$N_2(x)$ é uma função complicada de x !

$$N_2(r) = \frac{r(1+r)}{2}$$

$$= \frac{1}{2} (1 - \sqrt{4 - x}) [1 + (1 - \sqrt{4 - x})]$$

$$N_2(x) = \frac{1}{2} (6 - x - 3\sqrt{4 - x})$$

$$N_2(x) = \frac{1}{2} (6 - x - 3\sqrt{4 - x})$$

FUNÇÃO DE FORMA MAPEADA X GLOBAL

RESOLVENDO O PROBLEMA!

Usando regra da cadeia

$$\frac{dN_i(r)}{dx} = \frac{dN_i(r)}{dr} \frac{dr}{dx}$$

Conheço $\frac{dN_i(r)}{dr}$?

Conheço $\frac{dr}{dx}$?

$$\frac{dN_i(r)}{dx} = \frac{dN_i(r)}{dr} \frac{dr}{dx}$$

$$\frac{dN_i(r)}{dr} ?$$

$$N_1 = r \frac{(r-1)}{2}$$

$$N_2 = r \frac{(1+r)}{2}$$

$$N_3 = (1 - r^2)$$

Fácil...

Eu conheço: $x = \sum_{i=1}^3 N_i(r) x_i$

$$\frac{dr}{dx} ?$$

Portanto:

$$\frac{dx}{dr} = \sum_{i=1}^3 \frac{dN_i(r)}{dr} x_i = J$$

Jacobiano do mapeamento

$$\frac{dN_i(r)}{dx} = \frac{dN_i(r)}{dr} \frac{dr}{dx}$$

$$\frac{dN_i(r)}{dx} = \frac{1}{J} \frac{dN_i(r)}{dr}$$

O que faz o Jacobiano?

$$dx = Jdr$$

Mapeia um elemento diferencial das coordenadas isoparamétricas para coordenadas globais

EXEMPLO: JACOBIANO

Exercício: ache a matriz B para o elemento de 3 nós:

$$\mathbf{B} = \begin{bmatrix} \frac{dN_1}{dx} & \frac{dN_2}{dx} & \frac{dN_3}{dx} \end{bmatrix}$$
$$= \frac{1}{J} \begin{bmatrix} \frac{dN_1}{dr} & \frac{dN_2}{dr} & \frac{dN_3}{dr} \end{bmatrix}$$

$$N_1(r) = -\frac{r(1-r)}{2}$$

$$N_2(r) = \frac{r(1+r)}{2}$$

$$N_3(r) = 1 - r^2$$

MATRIZ DE RIGIDEZ DO ELEMENTO

$$K = \int_{x_1}^{x_2} EAB^T B dx$$

$$dx = Jdr$$

$$K = \int_{-1}^1 EAB^T BJ dr$$

1. A integral de QUALQUER elemento nas coordenadas globais é agora uma integral de -1 to 1 nas coordenadas locais;
2. O jacobiano J entra na integral da matriz de rigidez e, geralmente, é uma função de r . A forma específica de J é determinada pelos valores das coordenadas x_1 , x_2 e x_3 dos nós.

EXEMPLO: MATRIZ DE RIGIDEZ

Exercício: Ache a matriz de rigidez do elemento unidimensional de 2 nós:

$$N_1 = \frac{1}{2}(1-r) \quad N_2 = \frac{1}{2}(1+r)$$

$$K = \int_{-1}^1 EAB^T B J dr$$

J : Jacobiano relacionando o comprimento do elemento no sistema de coordenadas global com o comprimento do elemento no sistema de coordenadas natural:

$$J = \frac{dx}{dr} = \frac{L}{2}$$

$$\begin{aligned} N_1 &= \frac{1}{2}(1-r) \\ N_2 &= \frac{1}{2}(1+r) \end{aligned} \Rightarrow B = \frac{1}{L} \begin{bmatrix} -1 & 1 \end{bmatrix}$$

$$K = \int_{-1}^1 EAB^T B J dr \Rightarrow K = \frac{EA}{L} \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix}$$

Veja que:

$$\varepsilon = Bd = \frac{1}{L} \begin{bmatrix} -1 & 1 \end{bmatrix} \begin{bmatrix} u_1 \\ u_2 \end{bmatrix} = \frac{u_2 - u_1}{L}$$

ELEMENTO ISOPARAMÉTRICO 2D

ELEMENTO RETANGULAR PLANO

PROPRIEDADES DAS FUNÇÕES DE FORMA

- As funções de forma N_1, N_2, N_3 e N_4 são bilineares em r e s .

- Propriedade do delta de Kronecker

$$N_i(r, s) = \begin{cases} 1 & \text{para } x = x_i \\ 0 & \text{para } x = x_j \quad i \neq j \end{cases}$$

- Completude

$$\sum_{i=1}^n N_i(r, s) = 1 \quad \sum_{i=1}^n N_i(r, s)x_i = x \quad \sum_{i=1}^n N_i(r, s)y_i = y \quad \sum_{i=1}^n N_i(r, s)u_i = u \quad \sum_{i=1}^n N_i(r, s)v_i = v$$

$$N_4 = a + br + cs + drs$$

$$(1) \quad a - b - c + d = 0$$

$$(2) \quad a + b - c - d = 0$$

$$(3) \quad a + b + c + d = 0$$

$$(4) \quad a - b + c - d = 1$$

$$\begin{bmatrix} 1 & -1 & -1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix} = \frac{1}{4} \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \end{bmatrix}$$

$$N_4 = \frac{1}{4}(1 - r + s - rs) = \frac{1}{4}(1 - r)(1 + s)$$

Expressão geral:

$$N_i(r, s) = \frac{1}{4}(1 + rr_i)(1 + ss_i)$$

Valores nodais de deslocamento:

$$u_1 = 2$$

$$u_2 = 3$$

$$u_3 = 4$$

$$u_4 = 5$$

$$u_c = 2 \frac{1}{4} (1 - 0)(1 - 0) + 3 \frac{1}{4} (1 + 0)(1 - 0) + 4 \frac{1}{4} (1 + 0)(1 + 0) + 5 \frac{1}{4} (1 - 0)(1 + 0) = 3.5$$

CONTINUIDADE C^0

Coordenadas nodais element 01:

$$Nó_1 = (3,2)$$

$$Nó_2 = (11,3)$$

$$Nó_3 = (10,10)$$

$$Nó_4 = (4,9)$$

$$u_1 = 2$$

$$u_2 = 3$$

$$u_3 = 4$$

$$u_4 = 5$$

$$u_5 = 1$$

$$u_6 = 2.5$$

Coordenadas nodais element 02:

$$Nó_5 = (0, -5)$$

$$Nó_6 = (9, -3)$$

$$Nó_2 = (11,3)$$

$$Nó_1 = (3,2)$$

COORDENADAS E DESLOCAMENTOS

$$\begin{Bmatrix} u \\ v \end{Bmatrix} = \begin{bmatrix} N_1 & 0 & N_2 & 0 & N_3 & 0 & N_4 & 0 \\ 0 & N_1 & 0 & N_2 & 0 & N_3 & 0 & N_4 \end{bmatrix} \begin{Bmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \\ u_4 \\ v_4 \end{Bmatrix}$$

$$\begin{Bmatrix} x \\ y \end{Bmatrix} = \begin{bmatrix} N_1 & 0 & N_2 & 0 & N_3 & 0 & N_4 & 0 \\ 0 & N_1 & 0 & N_2 & 0 & N_3 & 0 & N_4 \end{bmatrix} \begin{Bmatrix} x_1 \\ y_1 \\ x_2 \\ y_2 \\ x_3 \\ y_3 \\ x_4 \\ y_4 \end{Bmatrix}$$

$$N_1 = \frac{(1-r)(1-s)}{4}$$

$$N_2 = \frac{(1+r)(1-s)}{4}$$

$$N_3 = \frac{(1+r)(1+s)}{4}$$

$$N_4 = \frac{(1-r)(1+s)}{4}$$

ELEMENTOS RETANGULAR DE MAIS ALTA ORDEM

- Mais nós
- Ainda 2 graus de liberdade por nó
- *Mais alta ordem* quer dizer mais alto grau de polinômio completo para aproximação dos deslocamentos.
- Duas famílias: Lagrangiana e Serendipity

ELEMENTOS QUADRILÁTEROS QUADRÁTICOS

1. Família Lagrangiana de Elementos

Elemento de ordem n tem $(n+1)^2$ nós arranjados simetricamente – requer nós internos para no. de nós > 4 .

2. Elementos Serendipity

Em geral, apenas nós de contorno – evita-se nós internos.

Não é tão preciso quanto os elementos lagrangeanos, porém evita certos tipos de instabilidade.

FUNÇÕES DE FORMA LAGRANGIANAS

- Usa-se um procedimento que automaticamente satisfaz a propriedade Delta de Kronecker para funções de forma.
 - Considere o exemplo de 6 pontos, unidimensional: a função vale 1 em r_3 e vale 0 em qualquer outro ponto.

$$L_3^{(5)}(r) = \frac{(r - r_0)(r - r_1)(r - r_2)(r - r_4)(r - r_5)}{(r_3 - r_0)(r_3 - r_1)(r_3 - r_2)(r_3 - r_4)(r_3 - r_5)}$$

FUNÇÕES DE FORMA LAGRANGIANAS

Pode-se resolver para qualquer número de pontos nodais em qualquer posição.

$$L_k^{(m)}(r) = \frac{(r - r_0)(r - r_1) \dots (r - r_{k-1})(r - r_{k+1}) \dots (r - r_m)}{(r_k - r_0)(r_k - r_1) \dots (r_k - r_{k-1})(r_k - r_{k+1}) \dots (r_k - r_m)} = \prod_{\substack{i=0 \\ i \neq k}}^m \frac{(r - r_i)}{(r_k - r_i)}$$

Não entram
termos $r - r_k$!

Polinômio de
Lagrange de
ordem m
no nó k

CLARO QUE TAMBÉM FUNCIONA....

Ache a função de forma do nó 4:

$$H_4^{(1)}(r) = \frac{(r - r_3)}{(r_4 - r_3)} = \frac{(r - 1)}{(-1 - 1)} = \frac{1}{2}(1 - r)$$

$r_3 = 1$
 $r_4 = -1$

$$V_4^{(1)}(s) = \frac{(s - s_1)}{(s_4 - s_1)} = \frac{(s + 1)}{(1 + 1)} = \frac{1}{2}(s + 1)$$

$s_1 = -1$
 $s_4 = 1$

$$N_4(r, s) = H_4^{(1)}(r) V_4^{(1)}(s)$$

$$N_4(r, s) = \frac{1}{4}(1 - r)(1 + s)$$

EXEMPLO: FUNÇÃO DE FORMA LAGRANGEANA

Ache a função de forma do nó 16:

$$V_{16}^{(3)}(s) = \frac{(s - s_7)(s - s_{13})(s - s_{12})}{(s_{16} - s_7)(s_{16} - s_{13})(s_{16} - s_{12})}$$

$$H_{16}^{(3)}(r) = \frac{(r - r_5)(r - r_{15})(r - r_{10})}{(r_{16} - r_5)(r_{16} - r_{15})(r_{16} - r_{10})}$$

$$N_{16}(r, s) = H_{16}^{(3)}(r) V_{16}^{(3)}(s)$$

TRANSIÇÃO DO LINEAR PARA QUADRÁTICO

$$\begin{aligned} N_1 &= \frac{1}{4}(1-r)(1-s) & -\frac{1}{2}N_5 \\ N_2 &= \frac{1}{4}(1+r)(1-s) & -\frac{1}{2}N_5 \\ N_3 &= \frac{1}{4}(1+r)(1+s) \\ N_4 &= \frac{1}{4}(1-r)(1+s) \\ N_5 &= \frac{1}{2}(1-r^2)(1-s) \end{aligned}$$

Se lembrarmos:

$$N_c = \frac{1}{4}(1-r)(1-s)$$

$$\therefore N_1 = N_c - \frac{1}{2}N_5$$

$$N_1 = \frac{1}{4}(1-r)(1-s) - \frac{1}{2}N_8$$

$$N_2 = \frac{1}{4}(1+r)(1-s)$$

$$N_3 = \frac{1}{4}(1+r)(1+s)$$

$$N_4 = \frac{1}{4}(1-r)(1+s) - \frac{1}{2}N_8$$

$$N_8 = \frac{1}{2}(1-r)(1-s^2)$$

$$N_5 = \frac{1}{2}(1-a^2)(1-b)$$

$$N_6 = \frac{1}{2}(1+a)(1-b^2)$$

$$N_7 = \frac{1}{2}(1-a^2)(1+b)$$

$$N_8 = \frac{1}{2}(1-a)(1-b^2)$$

$$N_1 = \frac{1}{4}(1-a)(1-b) - \frac{1}{2}(N_8 + N_5)$$

$$N_2 = \frac{1}{4}(1+a)(1-b) - \frac{1}{2}(N_5 + N_6)$$

$$N_3 = \frac{1}{4}(1+a)(1+b) - \frac{1}{2}(N_6 + N_7)$$

$$N_4 = \frac{1}{4}(1-a)(1+b) - \frac{1}{2}(N_7 + N_8)$$

SERENDIPITY

Definição do dicionário americano *Oxford* para [Serendipity](#):

The making of pleasant discoveries by accident.

Horace Walpole (1717-1797) *inventou* a palavra 'serendipity' depois de ler o conto "[Three Princes of Serendip](#)". Uma história persa antiga sobre 3 príncipes iranianos que, em viagem, faziam sempre grandes descobertas, por acidente e sagacidade, sobre assuntos que não conheciam.

FUNÇÕES DE FORMA SERENDIPITY

Funções de forma para nós internos dos lados são o produto de um **polinômio de n -ésima** ordem na direção **paralela** ao lado por uma **função linear** na direção **perpendicular** ao lado.

$$N_5(r, s) = \frac{1}{2}(1 - r^2)(1 - s)$$

Analogamente:

$$N_7(r, s) = \frac{1}{2}(1 - r^2)(1 + s)$$

Resolva: como seriam as funções de forma N_6 e N_8 ???

Funções de forma para nós de canto são **modificações** das funções do elemento quadrangular bilinear.

- 1: comece com a função de forma bilinear apropriada
- 2: subtraia a função de forma do nó interno, com peso apropriado
- 3: repita o passo 2 usando a função de forma e apropriado peso do nó interno do outro lado

$$N_1(r, s) = \frac{1}{4}(1 - r)(1 - s)$$

$$N_1(r, s) = \frac{1}{4}(1 - r)(1 - s) - \frac{1}{2}N_5$$

$$N_1(r, s) = \frac{1}{4}(1 - r)(1 - s) - \frac{1}{2}N_5 - \frac{1}{2}N_8$$

Resolva: como seriam as funções de forma N_6 e N_5 ???

TABELA DE FUNÇÕES DE FORMA

	Nós 1,2,3,4	Nó 5	Nó 6	Nó 7	Nó 8	Nó 9
N_1	$(1-r)(1-s)/4$	$-N_5/2$	0	0	$-N_8/2$	$-N_9/4$
N_2	$(1+r)(1-s)/4$	$-N_5/2$	$-N_6/2$	0	0	$-N_9/4$

4 NÓS

$$N_1(r, s) = \frac{1}{4}(1-r)(1-s)$$

8 NÓS

$$N_1(r, s) = \frac{1}{4}(1-r)(1-s) - \frac{1}{4}(1-r^2)(1-s) - \frac{1}{4}(1-r)(1-s^2)$$

$$N_5(r, s) = \frac{1}{2}(1-r^2)(1-s)$$

9 NÓS

$$N_1(r, s) = \frac{1}{4}(1-r)(1-s) - \frac{1}{4}(1-r^2)(1-s) - \frac{1}{4}(1-r)(1-s^2) - \frac{1}{4}(1-r^2)(1-s^2)$$

$$N_9(r, s) = (1-r^2)(1-s^2)$$

$$N_8(r, s) = \frac{1}{2}(1-r)(1-s^2) - \frac{1}{2}(1-r^2)(1-s^2)$$

ELEMENTO TRIDIMENSIONAL DE 8 A 20 NÓS

Arestas parabólicas

No espaço r, s, t

Funções de forma, nó a nó, dadas por:

i) nós de canto ($i \leq 8$)

Estendido aos nós vizinhos de meio de aresta

$$N_i(r, s, t) = g_i(r, s, t) - \frac{1}{2} \sum_j g_j$$

Estendido aos nós vizinhos de meio de aresta

ii) nós de meio de aresta ($i > 8$)

$$N_i(r, s, t) = g_i(r, s, t)$$

onde,

$$g_i(r, s, t) = \begin{cases} 0, & \text{se o nó } i \text{ não é incluído } (i \geq 9) \\ G(r, i) \cdot G(s, i) \cdot G(t, i), & \text{caso contrário} \end{cases}$$

com

$$G(\beta, i) = \begin{cases} 1/2(1 + \beta\beta_i), & \text{para } \beta_i = \pm 1 \\ (1 - \beta^2), & \text{para } \beta_i = 0 \end{cases}$$

DERIVADAS

- As deformações do elemento são obtidas a partir das derivadas dos deslocamentos com relação às coordenadas locais.
- Para obter a matriz de rigidez de um elemento precisamos da matriz B de transformação $u - \varepsilon$.
- Uma vez que os deslocamentos do elemento são definidos nas coordenadas *naturais*, precisamos relacionar as derivadas de x, y, z com as derivadas de r, s, t .

MAPEAMENTO ISOPARAMÉTRICO

1. O mapeamento isoparamétrico fornece a relação (r, s) com (x, y) , i.e., se um ponto (r, s) é dado em coordenadas isoparamétricas, pode-se computá-lo em coordenadas globais (x, y) usando as equações:

$$x = \sum_{i=1}^n N_i(r, s) x_i$$

$$y = \sum_{i=1}^n N_i(r, s) y_i$$

- 2. O mapeamento inverso JAMAIS será explicitamente computado...

Transformação de coordenadas é
única e inversível.

$$\begin{array}{l} x = x(r, s) \\ y = y(r, s) \end{array} \Leftrightarrow \begin{array}{l} r = r(x, y) \\ s = s(x, y) \end{array}$$

REGRA DA CADEIA

$$\frac{\partial f}{\partial r} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial r}$$

$$\frac{\partial f}{\partial s} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial s}$$

REGRA DA CADEIA...

$$\begin{aligned}\frac{\partial}{\partial r} &= \frac{\partial}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial}{\partial y} \frac{\partial y}{\partial r} \\ \frac{\partial}{\partial s} &= \frac{\partial}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial}{\partial y} \frac{\partial y}{\partial s}\end{aligned}$$

ou

$$\begin{bmatrix} \frac{\partial}{\partial r} \\ \frac{\partial}{\partial s} \end{bmatrix} = \begin{bmatrix} \frac{\partial x}{\partial r} & \frac{\partial y}{\partial r} \\ \frac{\partial x}{\partial s} & \frac{\partial y}{\partial s} \end{bmatrix} \begin{bmatrix} \frac{\partial}{\partial x} \\ \frac{\partial}{\partial y} \end{bmatrix}$$

ou

$$\frac{\partial}{\partial \mathbf{r}} = \mathbf{J} \frac{\partial}{\partial \mathbf{x}}$$

Operador
Jacobiano

**Pelas equações abaixo percebemos
a necessidade de encontrar J^{-1} ...**

$$\begin{bmatrix} \frac{\partial N_i}{\partial r} \\ \frac{\partial N_i}{\partial x} \\ \frac{\partial N_i}{\partial s} \end{bmatrix} = \begin{bmatrix} \frac{\partial x}{\partial r} & \frac{\partial y}{\partial r} \\ \frac{\partial x}{\partial x} & \frac{\partial y}{\partial x} \\ \frac{\partial x}{\partial s} & \frac{\partial y}{\partial s} \end{bmatrix} \begin{bmatrix} \frac{\partial N_i}{\partial x} \\ \frac{\partial N_i}{\partial y} \end{bmatrix}$$

Pode ser
calculado,
pois **N** é
função das
coordenadas
naturais!

Esta é conhecida como
matriz **Jacobiana (J)**
para o mapeamento
 $(r,s) \rightarrow (x,y)$

Precisamos desta
parcela para
computar a matriz **B**

EXEMPLO: CÁLCULO DE JACOBIANO

$$N_1 = \frac{(1-r)(1-s)}{4}$$

$$N_2 = \frac{(1+r)(1-s)}{4}$$

$$N_3 = \frac{(1+r)(1+s)}{4}$$

$$N_4 = \frac{(1-r)(1+s)}{4}$$

ELEMENTOS ISOPARAMÉTRICOS TRIANGULARES

Determinar a função linear que satisfaça:

$$u(0,0) = u_1 \quad u(1,0) = u_2 \quad u(0,1) = u_3$$

$$N_i(r_j, s_j) = \begin{cases} 1 & \text{se } i=j \\ 0 & \text{se } i \neq j \end{cases}$$

Solução:

$$u(r, s) = (1 - r - s)u_1 + ru_2 + su_3$$

Funções de forma

$$N_1 = r$$

$$N_2 = s$$

$$N_3 = 1 - r - s$$

$$\begin{aligned} x &= N_1(r, s)x_1 + N_2(r, s)x_2 + N_3(r, s)x_3 \\ y &= N_1(r, s)y_1 + N_2(r, s)y_2 + N_3(r, s)y_3 \end{aligned}$$
